

White Worm Control

How Does It Work?

In freshwater aquaria, the tiny white worm is a common occurrence when there are excess nutrients in the water. These worms of the Oligochaeta class mostly feed on sludge and detritus. While mainly harmless, some of them carry parasitic diseases. Their eggs are deposited into cocoons, which is difficult to remove by simple water changes. Vermex is an effective solution to this problem. When applied, Vermex gets absorbed into the worm's system and eventually kill them within a day. Repeated use will ensure that all adult worms as well as those newly hatched from the remaining eggs are eradicated. Vermex is not harmful to fish and other non-target animals.

How Much to Use?

8 drops per 50 litres of water (or a standard 2 ft tank) Do not overdose.
See bottle for instructions. Follow instructions closely.

What Should I Take Note Of?

For effective and safe control of Oligochaete. Caution: Do not refuse container. Keep out of reach of children, Avoid contact with eyes, Seek medical treatment immediately if product is swallowed. Keep in a cool and dry place. Store below 40°C. SHAKE WELL BEFORE USE.
